1 – The baseline year for calculations is 2019. The chosen consolidation approach for emissions is facilities under operational control. Following our acquisition of Keno Hill and changes to our mining method at Casa Berardi, our operational boundary has changed, and we are in the process of establishing a new baseline year and GHG reduction target. Gases covered in GHG emissions calculations include CO<sub>2</sub>, CH<sub>4</sub>, and N<sub>2</sub>O. Global warming potentials are obtained from the Intergovernmental Panel on Climate Change Fifth Assessment Report. Hecla continues to refine and improve its methodology to collect and report GHG emissions, and our emissions numbers are subject to change in future years.

2 – Scope 1 estimated employing U.S. Environmental Protection Agency (EPA) reporting standards, protocols, methodologies, and other related guidance. For vehicle combustion emissions, methods and emission factors from the Greenhouse Gas Inventory Guidance, Direct Emissions from Mobile Combustion Sources, from the U.S. EPA Center for Corporate Climate Leadership were employed. For non-vehicle combustion emissions (electricity generation, heating), stationary combustion emission factors from Subpart C – General Stationary Fuel Combustion Sources (Tables C-1 & C-2) of EPA's Mandatory Reporting of Greenhouse Gases Rule (40 CFR Part 98) / Greenhouse Gas Reporting Program (GHGRP) were utilized. The emission factor for explosives use was based on the Energy Use and GHG Emissions Inventory Worksheet, from The Mining Association of Canada.

3 – Scope 2 emissions are calculated from site-level sources. The Greens Creek mine is an interruptible customer of Alaska Electric Light & Power Company (AEL&P), required to purchase surplus hydroelectricity, so purchased electricity GHG emissions are zero. The CO<sub>2</sub>e emission factor for Mexico's National Electric System (2023) was used for the San Sebastian mine. The Casa Berardi and Lucky Friday mines use supplier-specific CO<sub>2</sub>e emission factors (2022) for the power supplied by Hydro-Québec and Avista, respectively.

Hecla's Nevada operations use a supplier-specific CO<sub>2</sub>e emission factor (2022) for the power supplied by NV Energy. The Yukon Territory CO<sub>2</sub>e emission factor (2021 value) from Canada's National Inventory Report, April 2023, was used for the Keno Hill mine. For Hecla's Montana operations, the NWPP (WECC Northwest) subregion CO<sub>2</sub>e emission factor from the U.S. EPA Emissions & Generation Resource Integrated Database (eGRID2022) was employed. Finally, Grouse Creek used the Idaho CO<sub>2</sub>e emission factor from the eGRID2022 database.
